

LoyaltyCards Customer Wallet — Android

Closed Testing Instructions

For: Google Play Closed Testing participants · **App:** LoyaltyCards (Customer Wallet) · **Testing window:** 14 continuous days — [start date] to [end date] · **Daily time needed:** roughly 5–10 minutes

Why this test exists

The goal is to make the Customer Wallet available across a wide variety of platforms. It's already fully tested and released on iOS (iPhone and Mac) — this Android closed test is the next step, bringing that same, already-proven experience to Android users too. The **Business** (Supplier) app for Android will be tested and released separately, in the near future; this particular test is about the Customer Wallet only.

Google requires at least **12 testers opted in continuously for 14 days** before a personal developer account can apply for full Play Store release. That's a fixed rule, not a judgement about how much there is to find in the app — LoyaltyCards is deliberately simple (collect stamps, redeem a reward), so this test is mostly about **accruing the required testing time with real daily use**, not hunting for edge cases. You'll be repeating the same routine every day for two weeks. That's expected — thank you for bearing with the repetition.

If anything ever does look wrong, though, we absolutely want to hear about it — see “Reporting Issues” below.

How this fits together in real life

LoyaltyCards is two apps, not one:

- **LoyaltyCards Business** (the “Supplier” app) — installed by a shop. The shop owner sets up a stamp card (how many stamps, reward, branding), and the app produces QR codes: one for customers to add the shop's card to their wallet, and one for adding a stamp at each visit.
- **LoyaltyCards** (the “Customer Wallet” app — **what you're testing**) — installed by a shopper. They scan a shop's QR codes to add cards and collect stamps, and redeem a reward once a card is full.

Normally, testing the Customer Wallet properly would mean also running the Business app on a second device to produce QR codes to scan. **This test pack skips that step:** the QR codes in the provided PDF are pre-generated exactly as the Business app would produce them, for six fictional test shops. You only need the Customer Wallet app installed — scan the provided codes as if a real shop had shown them to you at the till.

The one exception is **redeeming a reward**, which needs no QR code at all in this mode — you just tap a button in the app once your card is full, the same as a real shop visit.

Before You Start (once, on day one)

1. Install **LoyaltyCards** from the Play Store closed-testing link: **[insert Play Console opt-in / install link here]**
 2. Open the app once. No account, signup, or personal details are ever needed — that's by design, not something missing.
 3. Have the **QR code test pack** (`express_test_pack.pdf`) open on a second screen, or printed. All six sheets are used every day.
-

Daily Routine — repeat once per day, all 14 days

Every business is **Express Mode**, so every stamp scan works the same way: no waiting on anyone else, just your phone and the printed/on-screen QR code.

For **each of the six businesses** in the pack (Test Coffee, Green Grocer, Riverside Deli, Sunny Bakery, Willow Spa, City Books):

1. **Add the card.** Open the scanner (camera icon) and scan that business's **Add Card** QR code. It appears in your wallet immediately.

If you already have a card for this business from a previous day, scan it again anyway — a second card for the same business is expected with this daily routine and isn't a bug worth reporting.

2. **Collect stamps until the card overflows.** Scan the three **Add Stamp** QR codes in order — **+1**, then **+2**, then **+3** — waiting about **10 seconds** between each scan (the app enforces a short delay between stamps by design; scanning again too soon is expected to be briefly refused). Check the card after each scan.
 - Once the card shows as **complete**, scan **one more** Add Stamp code (any of the three). This pushes it past capacity — you should see a message that a new card was created for the extra stamp(s). That overflow behaviour is exactly what we're testing here.
 - If the card *isn't* complete yet after going through +1, +2, +3 once, just repeat the same three scans again from +1 until it is, then do the one extra scan to overflow it.
3. **Redeem.** On the completed card (the one from *before* the overflow scan — not the freshly-created overflow one), tap **Redeem**. No QR code needed for this step. Confirm the card resets and a new card appears for next time.

Move to the next business and repeat. Six businesses, same three steps each — that's the whole daily session.

A Note on the Sort Feature (Build 41)

At some point during the 14-day window, you may receive a Play Store update to a newer build that adds a **sort control** to the wallet's card list — a small icon near the top of the screen (next to Help and Settings) that lets you reorder your cards (Newest First, Oldest First, Name A-Z, Name Z-A).

If you get that update:

- Install it as you normally would, then carry on with the same daily routine above — nothing else changes.
- Optionally, give the sort icon a try once after updating: tap it, pick a different order, and confirm the card list reorders as expected. This isn't part of the required daily routine, just worth a look if you have a moment.

Reporting Issues

If anything crashes, looks wrong, or doesn't match these instructions, email ian.hamlet@dotconnected.com with:

- Which business/step you were on
- What you expected vs. what happened
- A screenshot if possible

We aim to respond within 48 hours.

Quick Daily Checklist

Print or screenshot this page for a fast reference each day.

Business	Add Card	+1→+2→+3 (repeat until overflow)	Redeem
Test Coffee	☐	☐	☐
Green Grocer	☐	☐	☐
